

Protecting your network, computers and confidential data is a top priority; for that, Howard recommends a strong, least-privilege access policy. While the concept of least privilege is relatively simple to understand—restricting access permissions to the fewest resources, functions, and areas necessary to perform an authorized activity—it can be complex to effectively implement, especially when you consider the many variables.

POLICY AND ACCESS

COMPLEX VARIABLES

- Heterogeneous systems
- Diverse computing environments
- Different types of user roles
- Third-party access
- Expanding number and types of applications and endpoints

HOWARD CAN HELP

Complex as it seems, it is possible, and Howard can help.
