

Physical Security Solutions

Physical Security Solutions

IP-based video surveillance has become the physical security solution of choice. It deters crime, violence, and other misbehavior, and it stretches your security budget by allowing you to monitor more locations with fewer personnel. Let Howard help you secure your facility. We offer everything from network cameras and video management software to complete systems—all easy to install, simple to operate, and readily adaptable as your needs change.

Video Surveillance

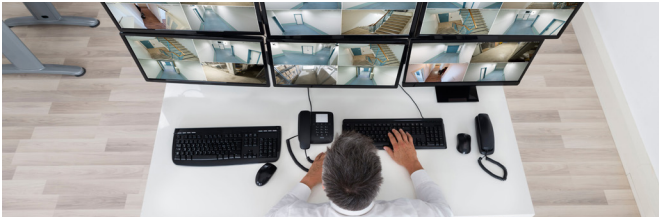

Video Surveillance end points can function as extra eyes and ears across your organization. They can act as silent sentinels to alert, detect, deter, and document incidents. Best of all, Video Surveillance cameras act as force multipliers, giving you the ability to be virtually in more than one place at a time.

Displays

Let Howard help you choose the right displays to outfit your Security Operations Center—ideal for nurses' stations and anywhere you need a virtual window into your world. We can help you balance your physical space, future needs, and budget to give you the best options.

Encoders

IP encoders are a great option if your facilities have existing non-IP cameras that you want to incorporate into a networked security system. They can help you maximize your current investment in cameras and cabling and ease the transition into IP technology.

Video Management Software

From basic video recording to complex analytics, including facial recognition, the Video Management Software is where it all happens. It is what determines how the data your security devices transmit is handled, and it can adjust the scope and bandwidth of that information as well. Howard can help you choose software solutions that best suit your needs.

Supporting Infrastructure

Howard can help you manage the network infrastructure needs associated with installing and updating your Physical Security estate. We can set you up with routers, switches, WAPs, cellular modems, cabling, encoders, servers, storage devices and more. From small to large scale, we have options for you.

Wireless

For applications where wired data connectivity cannot be achieved, Howard has a range of solutions that can use Wi-Fi and cellular technology to transmit data.

Control Systems

Think of them as smart locks, our Access Control systems can help limit access to restricted areas and track employee movement. Whether key-pad operated or RFID, you can tie in your access permissions with Active Directory and other third-party applications or manage them manually.

Mounting & Accessories

Howard carries a full line of mounting hardware for the cameras and sensors we sell, to ensure your devices are securely positioned right where they are needed and remain in place.

Storage

Properly configured, modern IP Video Surveillance takes up only a fraction of the data storage needs of analog or SDI video; however, it still requires a sizable amount of drive space. Howard offers local and virtual storage solutions, as well as hybrid versions, that can scale along with your needs and redundancy requirements. Let us help you choose an option that works for you.

Video Streaming

Streaming video from your VMS can help you turn any computer or mobile device into a Security Operations Center. You can apply permissions to make sure only people authorized to see a given feed can view it.

Cloud

With our cloud offerings you can receive alerts or check live and recorded video feeds from your facility anytime, anywhere, and from any device that has a data connection.

Cameras

We carry cameras that can operate with no data connectivity and can record using on-board memory cards.

Access Controls

Control, track, and manage access to any rooms, sections, or facilities with a customizable access control system. This system can also be integrated with your building's general management system and programmed to turn off lights, regulate the temperature, and control other cost-saving factors.
