INCLUDING  
MONITORING  
VIA A  
WEB BROWSER

## Library Controller & Remote Library Controller

**E**asy-to-use. Powerful. Accessible. Spectra Logic's Library Controller technology enables front panel or Web browser access to a complete suite of enterprise-class library management tools

### Multi-Function Interactive Color Touchscreen for Easy-To-Use, Reliable Control

Library Controller (LC) is a color touchscreen front panel user interface with straight-forward icon-based navigation allowing control of individual or multiple library functions. LC enables the operator to customize all management and diagnostic procedures for best library performance.

### The Perfect Management Tool for Networked Backup and Restore Operations Is At Your Fingertips

Configure one or more libraries to maximize operations among multiple servers, filers and software applications for ultimate scalability and consolidation of resources. Be assured of consistent and reliable procedures for moving tapes, creating library partitions, managing inventory and updating configurations.

### Monitoring and Diagnostic Capabilities for Fast Response

LC offers an extensive range of monitoring and alert functions key to maximizing system uptime.

- **SNMP for Alerts and Queries:** SNMP capability is modeled on the SNIA standard MIB. The system will issue SNMP alerts

covering a complete set of exception events. LC can send an e-mail alert if a library drive goes offline or there is a backup failure. The operator can be alerted to a temperature anomaly or abnormal software state. Additionally, the operator can set up regular reporting queries on library status (monitor internal library temperature, whether the Entry/Exit Port is open or closed or the number of power supplies), configurations and backup status.

- **SMTP Mail Support:**

This capability allows the operator to use LC to make sure all necessary parties are notified of event alerts and queries via e-mail and pagers. Information can automatically be sent to multiple addresses for an efficient and quick response program. LC with SMTP will even send support configuration files and log files.

- **Customization Tool:**

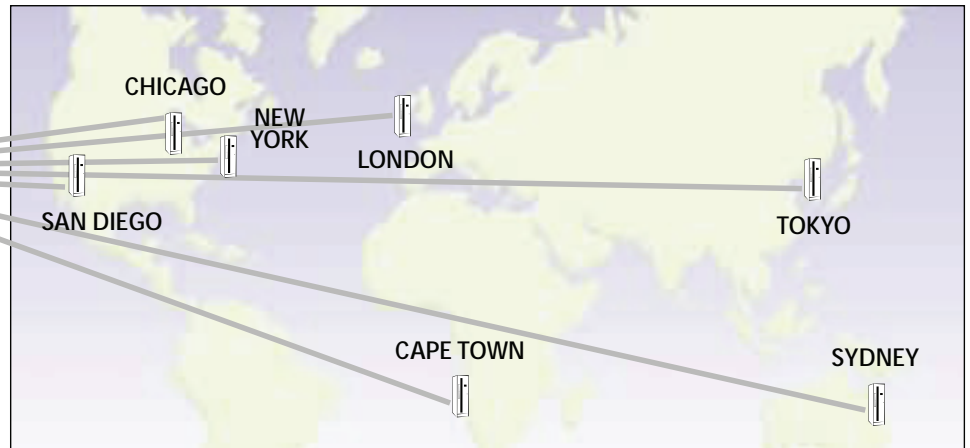

Create customized time-saving applications and tools via XML. For example, operators have used this tool to create an application that allows them to display multiple LCs, within one screen view, thus eliminating the confusion and inconvenience that results from having to move in and out of various individual library screens.

*continued*

YOU ARE HERE

*It doesn't matter where you or the library are, you're still in control with Remote Library Controller.*

• **On-line Help Available**

Clicking on the question mark icon takes the operator to a browser-based menu featuring topics about how to configure libraries, perform diagnostics, access alerts and, in general, provides answers to questions about common library management and monitoring functions. Most competitor's libraries do not offer this capability.

**Remote Library Controller Offers Convenient Remote Management**

Keep backup and restore operations running smoothly any time of the day or night with Remote Library Controller.

Easy operation via a Web browser offers the same library management capabilities, including SNMP and SMTP, as front panel LC. Security features accommodate up to three groups of users: super user, administrator or operator. RLC is an enhanced feature that adds to the basic capabilities of LC. There is an additional charge for RLC.

The performance reliability and user convenience of RLC will improve overall operator availability and efficiency throughout the data center.
